

Welcome to the Excel Hell

It is like a curse! People today suffer a lot in the "Excel hell"!

Excel applications are a great tool to build up ad hoc structured data. They are massively applied for communicating surveys, calculating budgets, keeping addresses, comparing product lists...

The better the Excel files are structured, the better the hell is fueled.

See here, how the Excel hell works:

Just try to find the current/latest version!

The adhoc Excel file was done quickly and efficiently. Intermediate versions were created. Finalized versions were saved with a dedicated file name. After a while it is no longer possible to tell which version is the actual one.

Just try to share the updating process hell! Input for the Excel files was given by sending the files by mail, by sharing on net-drives etc. After a while it is no longer clear who's version is the current one.

Have fun keeping all redundancies in sync!

As more and more information areas are covered and saved, the duplication of data becomes unavoidable. Now you are busy keeping the data that has been spread on different sheets

synchronized and updated.

Let everybody know about your secrets!

After a while you realize that while some of the information in the excel file was not for everybody's eyes, some information is important for public reports. So start copying and duplicating again and have fun synchronizing even more files with the original

data.

First lose your Excel files then lose your mind!

Ups, you forget to put the newest version on the drive and your PC has a disk crash. So find out which version was the latest, what structures did change lately, which information is restricted and which fields are redundant ...

Helping you out of the Excel Hell

With our proven solution ***RX Method*** we provide ***adhoc business applications*** at an affordable price. Customized business applications are known to be expensive, but not with our RX Method. We will show you that the investment in RX Method is more than returned within a few months!

RX Method shares many features with full fletched business applications except ***their price***. Our license terms can be seen on www.ooit.com/rx/rx-license.html)

- Data stored centrally in a relational database
- All data is accessed only by authorized personnel
- RX Method includes document management (upload, tagging, download)
- RX Method includes Google-like search

At the same time RX Method applications share the convenience of Excels without living in the Excel hell.

- Every attribute (Excel column) can be historized
- Editing data is managed by check out of single data objects
- Data can be freely linked without redundancies
- Data codes instead of plain text data (e.g. country codes)
- Strict authorization per attribute (Excel column) provides the confidentiality as needed
- Adding new attributes is as easy as adding a new Excel column
- Applications done with RX Method are 100% web-based. That means: ubiquitous access, no software installation on clients, no local data, no email delivery, no shared drives needed.
